Business Context

View Products

The client has asked me to allow customers to be able to view products with transparent pricing and availability of the products. Through this the customers will be able to view the full list of details for each products helping them know which products are available and which ones are not, and also the prices of each product so they know which ones are in their price range. Through this, the client will be able to see what products have been bought, and can edit the availability of each product when they run out of stock making customer experience much better as their orders can be fulfilled successfully and the system gives them a full detail list helping with their judgement of what to buy or not, meaning customers are more likely to return to GLH as their experience using the company's service was seamless, thereby leading to greater revenue. The company giving the users full details of the products will also help the client (GLH) make informed decisions about what products are being bought the most and what producers sell the best, ultimately helping them advertise better and also manage their stock better, as less bought items wouldn't need to be stocked more and might need to be dropped as a whole, helping cutting costs ultimately helping the business. Giving the customers full transparency can also lead to better brand reputation and trust in the brand. Offering transparency also gives GLH an advantage to its competitors that may not be doing so. Users will feel more confident about their purchases, users experience will be better as browsing items will be made easier.

Place Orders

The client has asked me to allow orders to be placed by users for collection or for delivery. Through this GLH will be meeting the needs of many as they are providing the option for both collection and delivery over long distances. This feature will also help users go for the option that fits their own schedule, as there will be less need to physically visit the store. This opens the scope of the business and as it will be made accessible to many, this increases the number of potential users, thereby leading to higher potential revenue.

Manage accounts

The client has asked me to allow users to be able to manage their accounts and also be able to manage their personal accounts and also view their order history. Through this, Users are given full access to the data the website gives them and are allowed to edit it to their liking, they are also given access to their previous orders and current orders, this will boost user experience as they have been given an intuitive UI for all of their needs and information. Personalised accounts mean users can "own their presence", as they have a personalised experience making them feel valued, users will be more likely to recommend GLH due to their smooth experience while using the solution, thereby leading to more revenue. GLH can also suggest products based on the users order history helping with advertisement. Users are also more likely to return and interact if they have their own accounts.

Producers

The client has asked me to provide users with information about the producers, their methods and the benefits of buying locally. Through this the web application educates users about where their products they are going to order are coming from giving the users full transparency helping with customer relationship. This also could help local farmers and food producers receive more appreciation and support as they are pushing their narrative. This could also help the business against potential competitors as they are getting their products locally and can guarantee the quality and freshness, leading to more customers thereby increasing revenue.

Dashboard

The client has asked me to provide a dashboard that allows producers to manage stock levels, update product details and view orders that have been made. Through this the client will have a good system going where product availability and stock gets updated frequently, helping with user satisfaction as well. This dashboard will also allow the client to view orders made so they can be carried out and delivered or prepared. This will make the clients website and order process run seamlessly as they can instantly get updated on new orders and can also update stock and availability directly. With real time stock and order data producers can make decisions on stock production to prevent overstock or understocks from happening.

Order Management

The client has asked me to provide users with the ability to manage their orders, scheduling and give them tracking features. This will enable users with full information about how their order is going and where it is at the time, if it is in transit, being prepared, etc. This will also give users the ability to alter the scheduling of their order if they want to and also manage the details of their order if they need to. This feature will help boost user experience as users are being full access and flexibility for their order. Transparent tracking will also build confidence that the business is reliable. Users can also edit their orders themselves reducing the need for calls and emails about things like that helping reduce support cost.

Accessibility Features

The client has asked me to provide the web application with features to support a wide range of users with difficulties or disabilities. These features could include keyboard navigation, adjustable text size, high contrast mode, text to speech and many more. This feature being implemented will help make sure that the web application is comfortable and conducive for everyone and adheres to WCAG laws. This will thereby boost user experience.

Loyalty

The client has asked me to create a loyalty scheme that provides discounts and special offers to the user. These schemes could include buy 1 get 1 frees, birthday discounts, holiday time discounts and even club cards for tokens, these types of discounts will make the users more likely to return as there’s a chance they can get those discounts again and also recommend the company to friends so they can also enjoy these benefits. Thereby increasing revenue.

Project Aim

The overall aim of the project is to provide GreenField Local Hub with an online web platform that:

- Provide information about the producers, their methods and the benefits of buying locally
- Allow customers to
    - View products with transparent pricing and availability
    - Place orders for collection or delivery
    - Manage their accounts and view order history
- Provide a dashboard to enable producers to manage stock levels, update product details and view orders.

Functional Requirements and User Acceptance Criteria

User Personas

Yves – A producer who needs to use the dashboard to prepare and update orders

Anne – An old aged woman who can not be very mobile and has to have her shopping delivered to her

Nakamoto – A user who won't be home at his time of delivery and has to reschedule his delivery time

Functional Requirement Table

Functional Requirement	***User Story***	***User Acceptance Criteria***	***Justification***
Users able to register	As Yves, Anne and Nakamoto, I want to be able to register an account for this web application so that I can access the main features of the website.	• View register button • Navigate to register page on register button interaction, located in the navigation bar • Enter register information • Interact with create button to create an account and be redirected to the log in page The page must comply with the Web Accessibility Guidelines (WCAG) e.g., keyboard	This feature will allow users to access the main features they need to experience the full application, since data is needed to create a properly tailored experience for the user. Which thereby improves user experience

		navigation, adjustable text size, high contrast mode.	
Users able to log in	As Yves, Anne and Nakamoto, I want to be able to log into my registered account, so that I can access and use the web application using the data I have provided and data that will be accumulated over time	• View login button • Navigate to login page on login button interaction, located in the navigation bar • Enter login information • Interact with login button to login into the user's account and be redirected to the home page The page must comply with the Web Accessibility Guidelines (WCAG) e.g., keyboard navigation, adjustable text size, high contrast mode.	This feature will allow users to access their accounts that they have already made, so they can actually get access into the web application, improving user experience.
Users able to change their log in details	As Yves, Anne and Nakamoto, I want to be able to change my log in details in case my details have been compromised or forgotten, so that I can set in new details.	• View log in button • Navigate to log in page on log in button interaction, located in the navigation bar • View change log in button • Interact with change login button to change login information • Enter new login information • Interact with confirm button	This feature will allow users to update their log in details and information bound to their accounts if they choose to change them when needed. This improves account safety as they can change their details if they are suspicious that their data might be compromised, and it will also negate user dissatisfaction if they happened to

		to confirm login information The page must comply with the Web Accessibility Guidelines (WCAG) e.g., keyboard navigation, adjustable text size, high contrast mode.	forget their login, they can simply choose to have it changed to something more memorable.
Users able to view privacy information	As Anne or Nakamoto, I want to be able to view privacy information, so that I can see and monitor how my data is being used.	• View Homepage • View navigation bar • View privacy button • Navigate to privacy page on privacy button interaction, located in the navigation bar • View privacy information The page must comply with the Web Accessibility Guidelines (WCAG) e.g., keyboard navigation, adjustable text size, high contrast mode.	This feature will ensure that the client is compliant with GDPR laws by being transparent about how user data is used by the application.
Users are able to view Information page	As Anne or Nakamoto, I want to be able to view the information page, so that I can see where the products are coming from and how they are being sourced and farmed to ensure safety.	• View Homepage • View navigation bar • View Info button • Navigate to Info page on Info button interaction, located in the navigation bar • View information The page must comply with the Web Accessibility Guidelines (WCAG)	This feature will ensure that the user is educated about the producers, their methods and the benefits of buying locally. This builds trust between the client and its customers as they are upholding utmost transparency by providing this information. This also supports ethics about

		e.g., keyboard navigation, adjustable text size, high contrast mode.	communication to customers, commitment to local producers and ethical sourcing. The information page will also help the web application align itself with laws guiding companies like GLH such as the EU Food Information to Consumers Regulation
Customers' ability to view products and their details and availability	As Anne, I would want to see all products that are in stock and their prices to help me make an informed decision on products I would want.	• View Homepage • View navigation bar • Click on "Shop" button on the navigation bar • Be redirected to the Shop page when Shop button is clicked on • View the Shop page • The page must comply with the Web Accessibility Guidelines (WCAG) e.g., keyboard navigation, adjustable text size, high contrast mode.	This feature ensures that users can properly tell apart products that are available and unavailable at the time. This also makes sure that users can see all products and their details to help make informed decisions on their orders. This will help boost customer experience and satisfaction as customers will have a smooth and seamless experience while using the solution as products will be properly labelled and their details will be properly displayed.
Allow customers to create orders	As Anne and Nakamoto, I would like to be able to create an order.	• View Homepage • View navigation bar • Click on "Shop" button on the navigation bar	This feature ensures users can properly create an order. This makes sure that users can browse products, select items and complete

		• Be redirected to the Shop page when Shop button is clicked on • View the Shop page • View Products • Click “Add to basket button” • Click “Basket” Button • Be redirected to basket page when basket button is clicked • View basket page • Click checkout button • Be redirected to checkout page • Pay for order • Order created • The page must comply with the Web Accessibility Guidelines (WCAG) e.g., keyboard navigation, adjustable text size, high contrast mode.	orders quickly and efficiently accommodating both quick shopping and browsing. A clear and reliable ordering process shows professionalism, helping to build a good brand reputation.
Allow users to manage their account	As Anne and Nakamoto, I would like to manage my account details to change the data that I have previously provided.	• View Homepage • View navigation bar • View profile button on navigation Bar • Click on “Profile” button • Be redirected to the Profile page when Profile	This feature allows a user to control their data accuracy, as they can keep their own data up to date, reducing errors in orders, or communication. This feature gives privacy compliance to the users, as they are given control over

		button is clicked on • View the Profile page • View Manage profile button • Click on manage profile button • Make necessary changes • View save changes button • Click save changes button • Be redirected to profile page after clicking save changes button • The page must comply with the Web Accessibility Guidelines (WCAG) e.g., keyboard navigation, adjustable text size, high contrast mode.	their own personal data which aligns with the GDPR and EU DPA, this enables features like deletion or export, which are legal requirements under GDPR. This also helps with security as users can update their passwords or security questions themselves. Helping prevent unauthorised access or account breaches.
Allow users to manage their order details	As Nakamoto, I would like to reschedule my time of delivery as I will not be home at the initial time of delivery	• View Homepage • View navigation bar • View profile button on navigation Bar • Click on “Profile” button • Be redirected to the Profile page when Profile button is clicked on • View the Profile page	This feature allows users full access to their orders and its details. It gives them the ability to change details of their order, including rescheduling their delivery or pickup, changing quantity, etc. This accommodates user error and reduces support costs as there will be a reduced number of emails or calls

		• View orders button • Click on Orders button • View Orders • View “Edit Order” Button • Be redirected to edit order page • Change delivery time/date • View save changes button • Click save changes button • Be redirected to orders page after clicking save changes button • The page must comply with the Web Accessibility Guidelines (WCAG) e.g., keyboard navigation, adjustable text size, high contrast mode.	about rescheduling or editing orders as this can be done by the users themselves. A good system like this shows professionalism, helping build the brands reputation. This feature gives the user a faster workflow as they don’t have to wait around for email confirmation about edits.
Accessibility Features	As Anne, I would like to be able to properly view the website as with my old age I would need the text to be more legible and colours to be customisable.	• View Homepage • View navigation bar • View Accessibility Icon on navigation bar • View accessibility features • The page must comply with the Web Accessibility Guidelines	The provision of Accessibility Features opens the scope of the website to accommodate people with disabilities. Features like Text To Speech, Dark mode, Contrast mode etc will be added to meet legal guidelines put in place such as WCAG 2.1, the Web accessibility Directive and others.

		(WCAG) e.g., keyboard navigation, adjustable text size, high contrast mode.	This will give the web application good UX and help it tend to a wider audience.
Authorization	As Yves, I would like to go on the producer dashboard to check if I have any orders to prepare	• View Homepage • View navigation bar • View Dashboard button on navigation Bar • Click on “Dashboard” button • Be redirected to the Profile page when Dashboard button is clicked on • View the Dashboard page • The page must comply with the Web Accessibility Guidelines (WCAG) e.g., keyboard navigation, adjustable text size, high contrast mode.	An authorization feature makes it possible to stop certain users from seeing certain things and other features. A normal user shouldn’t be able to view the producer dashboard, only producers should be able to do so, this aligns the web application with the data protection laws such as GDPR and the DPA, as unnecessary data is not being shared or used, this also guarantees safety for the producers that their data isn’t public to regular users. Authorization features are also scalable as the company grows and certain features and member roles are added.
Dashboard	As Yves, I would like to go on the producer dashboard to check if I have any orders to prepare	• View Homepage • View navigation bar • View Dashboard button on navigation Bar • Click on “Dashboard” button	This feature helps centralise all information the producers will need in one place. Reducing errors and saving time, this in turn allows the producers to plan their production schedule

		• Be redirected to the Profile page when Dashboard button is clicked on • View the Dashboard page • View Orders • The page must comply with the Web Accessibility Guidelines (WCAG) e.g., keyboard navigation, adjustable text size, high contrast mode.	effectively and correctly. Producers having real-time control and visibility of their orders will help with their user experience helping simplify their workflow.
Loyalty Features	As a returning customer, I want to receive discounts or rewards so that I feel appreciated and valued and encouraged to continue shopping at GLH.	• View Homepage • View Loyalty Program details • The page must comply with the Web Accessibility Guidelines (WCAG) e.g., keyboard navigation, adjustable text size, high contrast mode. • Tracking of points must follow GDPR, users must be able to see collected data.	This feature will help with customer retention and engagement, rewards and discounts encourage repeat purchases and strengthen customer loyalty. using the information displayed about the Loyalty program users can clearly see how many points have been earned through their purchases and how they can be redeemed ensuring fairness which helps with customer trust as they can fully understand and see that they are being treated fairly, promoting ethical marketing by

			avoiding hidden conditions, boosting UX. With such high UX this will also enable word of mouth marketing, as users are more likely to talk to their friends about the points system or other loyalty features.

Non-Functional Requirements

Performance

Requirement	***Justification***	***KPI***
The webpages must load in a time according to industry standards.	Webpages loading quickly leads to good user experience and good reputation for GLH	Webpages should load fully in less than 2 seconds on average FCP (first contentful paint) should be under 1.5 seconds Page size should remain under 2mb to prevent slow loading
The system must be able to handle a specific number of requests without slowing down.	This will ensure the core function of the website will still work at peak hours or busy days without slowing down the website significantly leading to bad user experience.	On average the system should be able to handle 10-15 requests per second without slowing down. Error rates of the solution should remain below 1% during peak usage Client side CPU usage should remain below 50% during interjections
The web application must not put a lot of loads onto the CPU	This will ensure low end devices can use the website without sacrificing	The CPU usage should be low enough that pages remain responsive on low end to typical user devices.

	significant speed of the website.	The solutions layout must function as planned/correctly on-screen sizes of 320px to 1920px All interactive elements must remain accessible without horizontal scrolling
The website must be responsive on devices with different size screens	This ensures users have a good experience despite the type of device they are on.	The website should pass mobile responsiveness tests as well as PC, tablet responsiveness tests.
The application should maintain minimal downtime	Having extended amounts of downtime could lead to loss of revenue, and create a bad reputation for the company	The system uptime should be at least 99.9% over a 30-day period. Unplanned down times should not be more than 1 hour per month System recovery after failure should occur within 10 minutes

Security

Requirement	***Justification***	***KPI***
The system must use encryption methods to protect sensitive data or information of users	Protecting user data is important for ensuring privacy and compliance with data protection laws such as the GDPR	All sensitive data, including payment information and personal data, should be encrypted using SHA256 Encryption. Password must be hashed and salted before storage No sensitive data should be stored in plain text within the database
The system must enforce strong password policies	This reduces the risk of accounts being easily compromised through brute-force attacks	Passwords must be a minimum of 8 characters and include a mix of uppercase, lowercase, numbers and special characters

		Accounts should be temporarily locked after 5 failed login attempts
The application must use HTTPS for all pages and APIs	HTTPs ensures that data transmitted between the user's browser and the server is encrypted, preventing attackers from stealing information using man-in-the-middle attacks	All pages must feature HTTPS security with valid SSL certificates, ensuring 0 traffic over HTTP.
Payment details should be hidden by default	This ensures customer data can't be stolen by someone shoulder surfing and viewing their screen	Card numbers and sensitive information should be replaced with asterisk characters to help hide said information. Only last 4 digits of card details should be visible Sensitive information should not appear in logs or error messages

Capacity

Requirement	***Justification***	***KPI***
The system must handle peak traffic without performance degradation	During peak hours, the platform should not slow down due to the amount of people on the web app at the time	The system should support extreme user load for testing/demo without any noticeable slow down Response time should remain below 1 second during load testing The system should be able to stay afloat while 100 users are being simulated onto it simultaneously during testing
The system must have enough storage capacity for user data and logs	Proper data storage ensures that booking history and logs are preserved for future referencing while preventing the system from running out of space	The system should be able to store high volumes of data and must be scaled up when necessary Database storage should

		not exceed 80% capacity before upgrading
The system should maintain health during scaling	As the system scales, it should maintain function and performance and have minimal downtime during scaling operations	The system should be able to maintain its uptime during scaling events System performance should not drop lower than 80% of normal speed during scaling Scaling operations should not cause more than 1 minute of service interruptions

Scalability

Requirement	***Justification***	***KPI***
The system should be able to handle increasing storage needs as data grows	Storage requirements for the system will increase as more users create bookings. The system should be able to provide additional storage when needed.	Storage should be able to be increased/modified Database queries should execute in under 1 second for standard operations
New functions should be added at an industry standard pace to the application	This will allow the client to show that they care about their customers user experience using the website, which will make the client seem more trustworthy.	On average, every new major function should be added within 5 to 10 days. Bug fixes should be deployed between 1-3 days of discovery New features should pass thorough testing before being pushed to the main system
The code for the application should be easily maintained and understandable to others	This will allow the website to get updates and features efficiently as other developers can understand and edit the code easily	A third party should be able to understand the coding conventions and basic functions and logics being used. Major functions should include comments explaining their use and functionality

		Code must follow industry standard naming conventions all through the system

Usability and Accessibility

Requirement	***Justification***	***KPI***
The system should have an intuitive user interface (Ui)	This will ensure that users do not get lost or confused when trying to navigate the system, improving satisfaction	> 70% of users should be able to complete key tasks without needing help from workers or developers on their first attempt. Average task completion should be under 5 minutes User satisfaction rating should be 4/5 in usability testing
The system should support multiple languages	Offering multi-language support helps on-native speakers use the platform comfortably improving satisfaction and accessibility	The system should support 1-2 different languages which users can switch between easily. Language switching should occur instantly without reloading the page All core interface elements must be translated in supported languages
The system must comply with Web Content Accessibility (WCAG) 2.1	This ensures that the web application creates a conducive environment for users with different disabilities or difficulties including visual, auditory and motor impairments	The system should pass WCAG 2.1 AA accessibility standards with 0% critical violations Images must contain descriptive alt text Colour contrast ratios must meet WCAG minimum standards.
The system should have consistent navigation	Consistency in navigation reduces confusion for users especially those with cognitive disabilities	95% of users must report that the navigation is intuitive and consistent across the platform

		Primary navigation page (homepage) must be accessible within 1 or 2 clicks at all times

Risk Management

General Project Risks (GPR)

1. Scope creep
2. Schedule delays
3. Lack of skilled Resources

General Technical Risks (GTR)

1. Data corruption
2. Scalability issues
3. Integration Failures
4. DDOS Attacks
5. Server Outages
6. Broken functionality after updates

Project-Based Risks (PBR)

1. Order editor not working
2. Wrong stock count or availability being shown
3. Producers not adopting the new system
4. Unauthorised users access the backend

Risk Matrix

Key:

Red coloured cells – High priority tasks

Impact	High		GTR1,GTR5	GPR1. GPR2, GTR2, PBR1	GTR4, PBR3, PBR4
	Significant			PBR2	
	Moderate				
	Low		GTR6		
		Low	Moderate	Significant	High
		Probability			

Risk Mitigation

Risk Description	***Probability***	***Impact***	***Mitigation strategy***
Scope creep	Medium	High	Define and set requirements clearly

			and use a top-down approach when planning.
Schedule delays	Medium	High	Use realistic timelines and track progress with milestones and regularly check progress.
Lack of skilled resources	Medium	High	Hire experts for the job and use resources that help with knowledge sharing and documentation
Data corruption	Low	High	Create regular backups, validation checks
Scalability issues	Medium	Medium	Implement load testing, auto-scaling into plan, and have fall back procedures in case of failures
Integration Failures	Medium	High	Test integrations and implement fall back procedures
DDOS attacks	Low	High	Use rate limitations, cloud protection services
Server outages	Low	High	Use redundancy fail over services. Disaster recovery plans
Broken functionality after update	Medium	High	Automated testing, staging environment, rollback plan, code reviews
Order editor not working	Medium	High	Thorough testing of order logic and its sub components such as creating, editing and deleting orders.
Product Stock count being wrong	High	Medium	Automatic stock reduction will be

			implemented, after an order the stock number will be updated to remove what has been ordered. Notifications will be sent out to producers when stock is low
Producers struggling to adopt using the dashboard	High	High	Provision of tutoring and guidance around the software. Provision of help personnel to answer their questions if they have any.
Unauthorised users access the backend	High	High	Severe testing of the backend security using brute force and other attack methods will be done after every update to ensure top security at all times.

Legal Consideration

Legal Regulation	Application
General Data Protection Regulation (GDPR)	The web application will be aligned to this regulation by making use of a privacy page. This page will serve the purpose of informing the users on how their data is being used. The company will also only collect data that is relevant and in use. Other ways the application will abide by this regulation will be through the use of encryption to make sure user data stays safe. The web application will also make users consent to their data being collected by making use of tick boxes or the option to accept cookies. Users will also be given right of erasure of their data at any time they want.
Equality Act 2010	To abide to this law, the web application will have features tailored to people with disabilities to change certain features to help

	them use the system. Text to speech for the visually impaired, high contrast modes, dark modes, text size changes, etc. The website will be compatible with screen reader technology for anyone who uses those to be able to use the solution. The website will feature clear and simple, non-technical language to negate confusion by users.
Payment Services Regulations 2017	To comply with these regulations, the solution will feature external payment system providers as they already have secure ways to process payments that comply with standards of the law. Using external payment systems also makes the solution more accessible as people with different payment methods can use it The system will also not store any card details in the database, reducing the risk of data breaches. The payment providers will also handle fraud detection and authentication helping comply with secure payment requirements.
Food Information Regulations 2014 and Food Safety Act 1990	To meet this regulation the web application will need to properly highlight any and all information about allergies, in the product page for each product to ensure safety of consumers and avoid confusion. Each product will have its full ingredient list listed on its page to inform customers about what is in it, product information will be updated and checked regularly.
Consumer Rights Act 2015	The web application will feature a page where all policies are listed, stating the customers rights and the companies' rights as well, users are therefore informed of the rights and the company's rules before shopping, this page will show return or refund policies and many more. The information on this application will be fully transparent and accurate and not misleading ensuring goods match with what is advertised. All terms and conditions will be written clearly so that they cannot be misinterpreted and users can easily understand them.

UI Consideration

The user interface needs to be simple, minimal and attractive, due to the company being big on the eco friendliness and local farming the website colour scheme should consist of greens, whites, cool grey, and more. The dark mode and high contrast modes will back off of the main colour schemes as well. Pictures used will be high definition and very descriptive

so as to serve their purpose correctly.
A simple and minimal interface will have to be employed in this solution as it reduces clutter and makes the website look cleaner, making navigation easier for users thereby increasing customer satisfaction. Green is often associated with nature sustenance and eco-friendliness which reflects with the company's beliefs directly which is why it will be a good main colour choice, it will be accompanied with cooler tones, cool greys, void whites, to give it more of a professional look as well as it serving its purpose of being void so actual elements stand out, For user accessibility and comfort dark mode and high contrast modes will need to be added as well as dark mode can severely reduce the strain on the eyes and high contrast mode is a way to make the solution more accessible to the visually impaired. The solution must feature high quality images so consumers can properly see what they are being sold before actually paying, this increases customer confidence in the quality of the products they are being sold. The website must also have a consistent design with consistent elements as well as users can rely on their memories while navigating. For example, the navigation bar must remain on the top of the page at all times for ease of access, removal on entry of one page can be off putting to a user.
